It includes a specific set of TSOs (Transactional Services Offered) for them that they can deliver to their end customers. The specific TSOs that are offered include secure access to IBM WebSphere application servers, secure access to IBM DB2 for z/OS, secure access to ZFS file system, secure access to the IBM DB2 for z/OS Data Loader and secure access to the IBM DB2 for z/OS as a development target. In addition, every client that is entitled to ZD&T can use the IBM DB2 for z/OS as a development target. For those of you unfamiliar with ZD&T, it is the service agreement that requires customer sites to make available a Development Target that can connect to IBM WebSphere Application Server and IBM DB2 for z/OS in a secure environment. If the client site is not entitled to ZD&T, they can make available a Testing Target for ZD&T, but no specific TSOs. Once a client site chooses to go with ZD&T, the only TSOs that can be provided are the ones listed above. So for example, if the client is an IBMmer and they use a PC, they can use the standard IBM WebSphere Application Server and DB2 for z/OS to access the same TSOs that are available to those that use the z/OS version. But if the client is an IBMmer and uses their z/OS PC, they can get the same TSOs using the z/OS version of DB2 for z/OS. And finally if the client is a z/OS user and they choose to access the TSOs using the TSOs that are available in the z/OS environment, they can access these TSOs using the z/OS version of DB2 for z/OS. The versions of the TSOs that can be accessed by z/OS are: DB2 for z/OS&n 82157476af
